Intercept BV Bin Vent Dust Collector

The Intercept BV Bin Vent Dust Collector efficiently retains bin and silo dust from escaping into the atmosphere. ProVent Bin Vents utilize pulse filter cleaning to maintain airflow and filter longevity.

- Continuous Pulse Filter Cleaning
- Vertically Mounted Filters
- Welded Couplings (1" NPT) for Fire Control Equipment
- NANO Web Fire Retardant Filters STANDARD!
- Vertically Mounted Filters, Sealing Via Dual Rail "Single Push" CAM Locking Assembly
- Various Power Options Available Including 575 Volts
- Optional Fan Assist
- Models up to 6,000 CFM

Our Cam-Loc mechanism makes changing the filters a breeze. The system also provides a tight seal separating the dirty air from the clean air.

Absolute Emissions from Canadian Oil Sands are Set to Decline Within Next Few Years Even as Production Grows

New S&P Global Commodity Insights report finds continuing efficiency improvements, as well as new technologies, are poised to overtake slowing production growth and result in absolute emission reduction by middle of this decade

By the middle of this decade greenhouse gas (GHG) emissions from Canadian oil sands production should be in decline even as production continues to grow, according to a new comprehensive report by S&P Global Commodity Insights that takes into account current technology trends and production growth.

Entitled The Trajectory of Oil Sands GHG Emissions: 2009-2035, the report by the S&P Global Oil Sands Dialogue says that long-term trends of reductions to the GHG intensity of oil sands production are set to reach an inflection point around 2025. Immediate pressure on absolute emissions to rise is expected in the short-term prior to that point. Absolute emissions are then expected to begin to decline from a level between 87-89 MMtCO₂e, even as production rises by more than 600,000 barrels per day during the same period (2020 to 2025).

The findings of the report confirm a preliminary analysis from the same team released earlier this year. “GHG intensity improvements do add up,” said Kevin Birn, vice president, GHG estimation and coordi-

nation, S&P Global Commodity Insights. "Our latest analysis shows that, if existing trends continue, they will overtake pressure from a slowing growth profile leading to absolute emission declines within the next few years."

From 2020 to 2035, S&P Global Commodity Insights projects GHG intensity of the Canadian oil sands could decline from 20-28% with some segments seeing much more dramatic reductions. Meanwhile, production growth in the study was projected to increase by more than 800,000 to 1.2 million barrels per day during this period. Most of that growth is expected to occur by 2025.

Efficiency improvements, including higher facility utilization rates as well as the roll-out and ramp-up of newer, less GHG-intensive operations have been leading contributors to past intensity reductions. These factors are expected to continue to play a role in future. However, carbon capture and storage as well as what S&P Global Commodity Insights is calling steam displacement technologies have the potential to result in more dramatic reductions.

"Although it can take time to be developed, carbon capture and storage is a wildcard when we look at technologies that can really make a difference for large industrial scale emitters like in the oil sands," Birn said. "Another wild card is the increasing use of what we are calling steam displacements technologies in thermal oil sands operations. This category of technologies can materially reduce the steam, and thus emissions required to produce a barrel of oil."

Steam displacement technologies physically replace steam required per barrel with solvents, or noncondensable gas like methane. These technologies can have large implications for oil sands thermal ex-

traction emissions and can even result in increased productivity.

"We were struck by the some of the success of steam displacement technologies occurring in the field," Birn said. "They show great potential to influence future oil sands GHG emissions and even enhance the level of future production.

"This new S&P Global Commodity Insights analysis is arguably the most rigorous examination of oil sands GHG emissions to date and the findings that, even if current trends continue, absolute emissions are set to decline within the next few years are profound," Birn said. "This may yet prove to be a conservative estimate with both industry and governments in Canada vowing to take more material actions to lower the oil sands emissions profile and improve the long-term carbon competitiveness of the sector to better compete through the energy transition."

S&P Global Commodity Insights estimates that the announced ambition of Oil Sands Pathways to Netzero—a consortium of major oil sands producers representing more than 95% of industry output—could result in oil sands GHG emissions falling by 19 MtCO₂e by 2030 relative to 2020. That is 17 MMtCO₂e lower than S&P Global Commodity Insights projection for 2035. Recently the government of Canada announced it could be seeking even greater reductions from the sector.

Martin Brower Integrates First Volvo VNR Electric into its Montreal Fleet to Serve McDonald's Canada Supply Chain

Volvo Trucks North America customer Martin Brower, a leading supply chain solutions provider for restaurant chains around the world, has introduced its first Volvo VNR Electric Class 8 tractor to its global fleet. The zero-tailpipe emission tractor will be dedicated to pulling McDonald's-branded trailers for food and beverage deliveries to McDonald's restaurants in the Montreal area. Mar-

tin Brower has been a key supply chain partner for McDonald's globally since it opened its first restaurant in the U.S. in 1956 and works closely with the restaurant leader to help reduce its global carbon footprint.

"We are excited to partner with our long-time customer Martin Brower to be the first to deploy a Volvo VNR Electric in Montreal in collaboration with McDonald's Canada," said Paul Kudla, managing director for Canada, Volvo Trucks North America. "It's a strong statement when all key partners align towards clear greenhouse gas emissions reduction goals. We look forward to continued collaborations with both organizations as they begin their electromobility journey."

Ideally suited for local and regional freight distribution, the Volvo VNR Electric tractor will deliver to local McDonald's restaurants within a range of 150 km (95 miles) of Martin Brower's Montreal Distribution Centre, located in the Baie-D'Urfé area. McDonald's Canada is conducting a trial of the Volvo VNR Electric as part of a plan to assess the feasibility of scaling alternative fuel vehicles to service its more than 1,400 restaurants across Canada where possible. The Quebec location also provides the ideal opportunity to demonstrate the effectiveness and reliability of the battery-electric drivetrain and components in the heat of a Montreal summer and the cold, snow, and ice of winter. To ensure the Volvo VNR Electric

tractor is charged and ready to support daily deliveries, Martin Brower has installed onsite charging infrastructure.

"Our goal is to deliver innovative and meaningful solutions to help restaurants and our business create a more sustainable, ethical, and responsible future — every day, all over the world," said Julie Dell'Aniello, president, Martin Brower Canada. "By integrating the Volvo VNR Electric tractor into our fleet, we will gain valuable experience for future zero-tailpipe emission tractor deployments that will enable us to continue driving down Martin Brower's greenhouse gas emissions so we can meet our sustainability targets."

In business for more than 60 years, Martin Brower has grown into a multi-billion-dollar company, that services more than 25,000 restaurants in 18 countries including more than 1,400 in Canada. Martin Brower's global commercial fleet has grown to more than 2,300 vehicles, including almost 40 in Montreal. Utilizing the Volvo VNR Electric in its daily delivery routes for McDonald's will enable Martin Brower to evaluate future opportunities to deploy additional zero-tailpipe emission tractors in their fleet. This

is a key part of Martin Brower's ambitious, long-term journey to achieving a significant reduction in carbon emissions per ton delivered by 2030 in collaboration with the Science-Based Targets initiative.

The trial aligns well with McDonald's global commitment to achieve net zero emissions across its global operations by 2050. The addition of the Volvo VNR Electric to the supply chain fleet is one way the Canadian company will contribute to McDonald's global greenhouse gas emissions reduction goal.

"The trial of the VNR Electric model vehicle in Montreal is another example of how we continue to evolve our business to meet the current moment and rise to future challenges," said Jacques Mignault, president and CEO, McDonald's Canada. "Together with Martin Brower and Volvo Trucks, we look forward to understanding how this trial can help us get closer to McDonald's global net zero emission goals."

The tractor will be serviced by

Camions Volvo Montreal, which was recently announced as one of the first two Volvo Trucks Certified Electric Vehicle dealerships in Canada. Its sales team is fully educated to consult with customers that are considering investing in any of the Volvo VNR Electric model configurations. Its service team has also been fully trained and equipped to safely maintain and repair the Volvo VNR Electric's drivetrain and components.

"As a Volvo Trucks Certified EV Dealer, we

are ready and able to support our customers with their greenhouse gas emission reduction transportation goals," said Jean-Francois Bibeau, general manager for Camions Volvo Montreal. "Electric is the future of transportation, and this is an exciting first step as we help to lead the transition to battery-electric tractors in Canada."
